

Perennial Callused Cuttings are Now Available from Danziger Guatemala

"When scheduling propagation, having perennial callused cutting options coming out of Danziger is a fantastic option for growers looking to reduce rooting time and get a higher percentage take. There is a large range of perennial genus available, representing a lot of good perennial breeding work from ThinkPlants participants, that are available in the callused cutting form from Danziger Guatemala. This program allows for accelerated rooting in a wide range of programs," states **Joey Wiseman, Head of ThinkPlants**,

"The callus cutting program shipping from Danziger Guatemala can help growers produce items that are difficult to root or often suffer large losses in propagation" says **Randy Uhl, Danzigers R&D Coordinator for North America**. "Lavender is one genus with the greatest benefit since the callus reduces propagation time and there is less moisture required to maintain the crop the first 5 days. We have also seen callus products versus URC's have larger leaves and mature more quickly in the liner stage. Possibly plants can extract nutrients sooner with earlier root development."
